

**We hope
you're
enjoying
your
tree**

To ensure growth and keep sidewalks from buckling, nothing is more important than watering your tree.

For the first three years, young trees need slow, deep watering during the dry weather

15 gallons of water per week

Water the tree near the trunk base with a slow soak:

Set your hose to a **slow trickle** for about 2 hours.

Or, place a **bucket with a small hole (1/8")** drilled near the bottom. Fill the bucket with water and allow it to drain into the soil.

Deep water encourages roots to grow down. Sprinklers leave water on the surface and encourage shallow roots. Watering your lawn won't replace the need to deeply water young trees.

**...and thanks for Keeping
Eureka Beautiful!**
